Atlantium AI

Agentic Defence Framework · Executive Plan

Machine-speed containment in 90 days

A 30/60/90-day plan to detect, contain and investigate AI-driven attacks before they become incidents, using the security tools you already own.

8
attack patterns contained automatically, in seconds

< 5 min
from alert to AI-assisted investigation

~55–60%
of intrusions stopped at machine speed (modeled)

Prepared by **Atlantium AI** · atlantiumai.io

October 2026

EXECUTIVE SUMMARY

Attackers now move at machine speed. Our response has to as well.

AI-driven attackers can go from first access to impact in minutes. CrowdStrike's fastest observed eCrime breakout time is 27 seconds. When every containment decision waits for a person, defenders lose that race by design.

This plan pre-approves a small set of **reversible** containment actions, fired automatically by **high-confidence** detections, on **low-risk targets** first. An **AI triage agent** investigates everything else in minutes. It runs on tools you already own: EDR, SIEM, identity provider, cloud consoles and an automation platform.

8	< 5 min	< 5 min	~55–60%
attack patterns contained automatically by day 90	alert to agent investigation and recommendation	detect-to-contain target, proven by simulation	intrusions stopped at machine speed, vs. ~10–20% typical today

Impact figures are modeled estimates from initial-access mix and coverage; the day-90 simulated attack replaces them with measured results.

HOW ATTACKS GET IN

Three ways in, one response rule

PULLED IN

Brought in by a user or AI agent

Phishing, downloads, fake fixes, a prompt-injected AI agent. Starts on workstations.

PUSHED IN

Exploited from the internet

VPNs, firewalls, web apps. The top breach vector. Starts on servers and edge devices.

WALKED IN

Valid access, misused

Stolen passwords and sessions, MFA abuse, vendor access. Starts in the identity provider.

Once inside, attackers get the keys, blind the guards, move, then cash out. Our rule is simple: **cut off whatever they're using.** If it's a host, isolate it. If it's an identity, kill its sessions. If it's a cloud key, revoke it.

THE APPROACH

Three tiers of response

FOUNDATIONS

Permission and visibility

A signed containment policy, every asset and identity tagged with what automation may do, critical logs flowing, and a log of every action taken.

TIER 1 · AUTOMATED

Contain in seconds

Near-certain detections trigger reversible actions automatically, on low-risk targets only, after two weeks in recommend-only mode.

TIER 2 · AI TRIAGE

Investigate in minutes

An AI agent investigates everything else and recommends. It earns autonomy one action at a time, at ≥ 95% agreement with analysts.

AUTOMATION AT DAY 90

What runs on its own, and what doesn't

DETECTION	RESPONSE	DAY 90
Decoy, fake credential or decoy account touched	Isolate machine, sign the user out everywhere	Automatic
Credential theft on a machine	Isolate, sign out, reset credentials, block attacker sites	Automatic
MFA fatigue, then an approval	Sign out everywhere, reset password and MFA	Automatic
Machine-speed reconnaissance	Isolate workstation, sign the session out	Automatic
Ransomware preparation	Isolate, disable the user, block attacker sites	Automatic
Cloud logging or security tools turned off	Turn them back on, revoke the actor's cloud access	Automatic
Stolen cloud credentials in use	Revoke active cloud sessions, page on-call	Automatic
Security tool tampering + a second signal	Sign out, attempt isolation, page on-call	Automatic
Everything else serious	AI agent investigates and recommends; analyst decides	Recommend
Critical servers, executives, service accounts, root and break-glass	Page a human immediately	Human only

THE 30 / 60 / 90 DAY PLAN

From permission to proven, in three phases

Phases are balanced by effort. The first month is light on engineering because signatures, owners and inventories take calendar time.

DAYS 1–30

See and authorize

- Containment policy signed by leadership
- Every workstation marked safe to auto-isolate; servers default to page-a-human
- Action log live: the help desk can answer "did security do this to me?"
- Critical logs confirmed flowing
- Internet-facing systems inventoried; edge management taken off the internet
- Decoy files, fake credentials and decoy accounts deployed
- Read-only AI agent reports blind spots

Exit: policy signed, workstations tagged, first blind spot report delivered

DAYS 31–60

Build actions, learn the noise

- Response actions built and tested with one-click undo: isolate, stop a process, block a site, sign out everywhere, disable, reset credentials
- EDR in block mode everywhere, coverage gaps closed
- Decoys go fully automatic
- Other detections run in recommend-only mode
- AI triage agent writes up every high-severity alert, risky sign-in and new MFA registration

Exit: every action proven, decoys automatic, every high alert investigated in minutes

DAYS 61–90

Cloud, edge, go automatic

- Azure and AWS: disabled logging restored automatically, stolen cloud credentials cut off
- Edge device admin and config changes investigated
- Detections with a clean record go automatic for low-risk targets
- Phishing-resistant MFA for every admin
- Safe simulated attack measures detect-to-contain

Exit: 8 detections automatic, time to contain measured, board scorecard

SAFETY BY DESIGN

Automation that can't take the business down

- **Recommend first.** Nothing acts on its own until it has run two clean weeks in recommend-only mode.
- **Low-risk targets only.** Workstations, standard users and human cloud accounts. Critical systems always go to a person.
- **One-click undo and bulk undo** on every action, plus rate limits that page on-call when hit.
- **A full action log**, so anyone can find out in a minute whether security acted on them, and why.
- **Our tools can't cause an outage.** A circuit breaker pauses automation during an EDR vendor outage, and tampering alerts need a second signal.
- **Attackers can't turn it against us.** Mass decoy hits become one investigation, not mass isolation.
- **Prompt injection never triggers containment.** Text planted for our AI agent goes to an analyst, not to an action.
- **The AI earns autonomy** one action at a time: ≥ 95% agreement with analysts, zero harmful calls.

CLOUD, SAFELY

Matching the action to the identity

CLOUD IDENTITY	AUTOMATIC	RECOMMENDED
People (users, human roles)	Revoke sessions, deactivate keys, deny-all policy	—
Workloads (apps, CI/CD, services)	Revoke active sessions: workloads get fresh credentials, the attacker's copy dies	Deactivate keys, deny-all
Root, break-glass, org admin, security tooling	—	Human only
Anyone who turned logging off	Logging restored, always	—

DELIBERATELY DEFERRED TO NEXT QUARTER

AI agent kill switch · Phishing response automation · Network-level quarantine · Cloud server isolation · SaaS-level detections · Data-theft analytics · Threat hunting · Hypervisor monitoring

These are the expensive 20%. They return next quarter with 90 days of data behind them.

MAKING IT HAPPEN

What we need, and how you'll know it worked

WHAT WE NEED FROM LEADERSHIP

Sign the containment policy	Day 30
Mandate phishing-resistant MFA for admins	Day 1
Edge device management off the internet	Days 1–30
15 minutes per app owner: "can we isolate this server?"	Days 31–60
Read-only API access for agents; automation platform access	Day 1

HOW YOU'LL KNOW IT WORKED

EDR coverage in block mode	> 95%
Attack patterns contained automatically	8
Alert to investigation	< 5 min
Detect-to-contain (simulation)	< 5 min
Admins on phishing-resistant MFA	100%
Edge management exposed to internet	0

THE FINISH LINE

"Basics done" means yes to all of these

- ☐ Automated containment is pre-approved in writing
- ☐ Every host, identity and cloud account is tagged with what automation may do
- ☐ EDR blocks on > 95% of hosts and critical logs are flowing
- ☐ Every action has undo, rate limits and a searchable log
- ☐ Decoys contain whoever touches them
- ☐ Eight attack patterns are contained in seconds
- ☐ Edge devices are locked down and patched within 72 hours
- ☐ Everything else gets an AI investigation in under 5 minutes

Get 80% of the protection for 20% of the effort, then build on it.
